SystemsThatAreInteractive

Overall Concept

- The concept seems ambitious and focused in providing the necessary tools for an individual to improve upon his/hers skills.
- A down point is the screen-by-screen description of the interface, that should be detailed further on the wireframes.

- Instead of describing the interface, more details could have been given as to the usability and purpose of the app.

- Nevertheless, the idea of having the features spread through the different screens, if properly implemented, is interesting as it allows the user to have multiple features without been overwhelmed with them.

Personas

- Personas need a name to be used as a reference in the next stages of the project, as well as individualise each and give focus to the project.

- Connecting faces to the names would be good, e.g. stock photos or drawings, as it provides a sense of familiarisation with them.

- Age and gender are standard attributes to include.

- Your personas would benefit from additional descriptions around their:
    - background: what is their current level of fitness, are they active or passive? And whether or not they run/cycle already?; you have this for the first but not the second.
    - situation: how much free time do they have, do they have an active job, kids?
    - experience: have they used a fitness tracker before, or any other activity tracking?

Scenarios and/or Storyboards

- The scenarios described need a subject, they should provide details about the individual undertaking these actions or be connected to the personas.

- There's a good range of goals and they all seem to portray the different ways of interacting with the app.

- The last scenario is an outlying case, as it describes a dyslexic person interacting with the app and reveals a deep understanding of HCI practices by providing support to a special group and assuring maximum comfort to all.

Wireframes and Interface designs

- The Dashboard seems to be the only place from where it is possible to view the stats for a single run; it would be good to have the option to compare results with the previous run, once another one is completed, without having to compare it with all the other races.

- The design is simplistic and appear to be visually appealing.
